

## ***Guided Surgery and the role of the Restorative Dentist***

Guided surgery has been used in increasing numbers of clinical situations, particularly when the prosthetic demands for the patient are high. The Immediate Load treatment protocol has also enjoyed higher success with guided surgery and increased the predictability when delivering a conversion prosthesis at the time of surgery. This hands-on course will review guided surgery parameters and introduce the new Guided Surgery Kit from Dentium Implants. Emphasis will be placed on the diagnostic work-up necessary to establish proper implant placement and to insure that the surgical guide, along with the Guided Surgery Kit, will provide the crucial portions of the guided surgery protocol.

At the completion of the course the participants should be able to:

1. Understand the necessary diagnostic steps to provide guided surgery
2. Understand the digital workflow to provide guided surgery
3. Be able to implement the Guided Surgery Kit from Dentium Implants when placing Dentium Dental Implants for their patients
